How I learned research methods: Notes from a development program

HOMMA, Junko

In 1999 and 2000 I applied to a teacher development program at the National Institute for Japanese Language. My original research plan was based on a quantitative framework. However through the program classes and reading materials I came to understand the importance of the alternative interpretive paradigm. I learned how to do effective fieldwork and how to properly complete an ethnography, based on data grounded theory. I intend to carry out my future research on children's language acquisition using ethnographic methods which I learned over the two-year experience.

Key-words: child language, field work, ethnography, hypothesis generation, practice
